Common Features:

Straps are spaced for PALS/MOLLE webbing compatibility.

The front strap creates a loop to take a ferro rod. The ferro rod is secured with elastic looping over itself.

Straps are secured with two bolts each, this minimises rotation of the strap and helps to stop the bolts working loose.

All sheaths have an elastic retention strap which pulls out of the way when withdrawing the knife to avoid the strap being cut.

All parts of all sheaths are modular so the sheath can be fully stripped down for cleaning and maintenance.

All sheaths are primarily designed for scout carry so if they are carried on the hip they will hang with the blade facing forwards, this does not affect the function of the sheath (or the sheath can be carried on the left hip as shown).

To carry on the stomach (cross draw) the sheath must be left handed (for a right handed person) or carried upside down.
